

*Make the right decision...*

“Accidents don't just happen; they are caused, by lack of **RISK MANAGEMENT.**”

1. Identify all possible negative outcomes, “using what IF.”
2. Assess the entire outcome by their chance of happening.
3. Prioritize the risks: list them in order of their likelihood, and how much of an impact on project that risk will have if it happens.
4. Select the optimal level of risk, to get the job done.
5. Implement this decision.

**6. Periodically make sure this decision still works.**

**Safety Depends on You**
